

Sample Quiz 4, with Solutions

---

1. Let  $A$  be an orthogonal  $n \times n$  matrix (recall this means that the columns of  $A$  are orthonormal), and let  $A^\top$  be its transpose.

(a) Find:

$$AA^\top = I_n \text{ [This is equivalent to columns of } A \text{ being orthonormal].}$$

$$A^\top A = I_n \text{ [Since, by the above, } A^\top = A^{-1}, \text{ and we know that } A^{-1}A = I_n].$$

(b) Find:

$$\dim(\ker A) = 0 \text{ [Since } A \text{ is invertible, and so } \ker A = \{\vec{0}\}].$$

$$\dim(\operatorname{im} A) = n \text{ [Since } \dim(\operatorname{im} A) + \dim(\ker A) = n].$$

(c) Is  $A^\top$  also orthogonal? Explain your answer.

$$\text{Yes, since } A \text{ orthogonal} \iff AA^\top = I_n \iff A^\top(A^\top)^\top = A^\top A = I_n \iff A^\top \text{ orthogonal.}$$

(d) Are the rows of  $A$  orthonormal? Explain your answer.

$$\text{Yes, since the rows of } A \text{ are the columns of } A^\top, \text{ which we just saw is orthogonal.}$$

(e) The  $QR$ -factorization of  $A$  is given by:

$$Q = A \text{ [Since } A \text{ is already orthogonal, so its columns make up } Q].$$

$$R = I_n \text{ [Since } A = QR \text{ gives } R = Q^{-1}A = A^{-1}A = I_n].$$

2. Find all orthogonal matrices of the form

$$A = \begin{bmatrix} \frac{\sqrt{2}}{\sqrt{3}} & \frac{1}{\sqrt{3}} & a \\ -\frac{\sqrt{2}}{2\sqrt{3}} & \frac{1}{\sqrt{3}} & b \\ \frac{\sqrt{2}}{2\sqrt{3}} & -\frac{1}{\sqrt{3}} & c \end{bmatrix}$$

The orthonormality conditions  $\vec{v}_1 \cdot \vec{v}_3 = 0$ ,  $\vec{v}_2 \cdot \vec{v}_3 = 0$ ,  $\vec{v}_3 \cdot \vec{v}_3 = 1$  yield:

$$\begin{aligned} a - \frac{1}{2}b + \frac{1}{2}c &= 0 \\ a + b - c &= 0 \\ a^2 + b^2 + c^2 &= 1 \end{aligned}$$

The first two equations give  $b = c$  and  $a = c - b = 0$ . Plugging into the third equation gives  $2b^2 = 1$ , and so  $b = \pm \frac{1}{\sqrt{2}}$ . The two solutions for  $A$  are:

$$A = \begin{bmatrix} \frac{\sqrt{2}}{\sqrt{3}} & \frac{1}{\sqrt{3}} & 0 \\ -\frac{\sqrt{2}}{2\sqrt{3}} & \frac{1}{\sqrt{3}} & \frac{1}{\sqrt{2}} \\ \frac{\sqrt{2}}{2\sqrt{3}} & -\frac{1}{\sqrt{3}} & \frac{1}{\sqrt{2}} \end{bmatrix} \quad \text{and} \quad A = \begin{bmatrix} \frac{\sqrt{2}}{\sqrt{3}} & \frac{1}{\sqrt{3}} & 0 \\ -\frac{\sqrt{2}}{2\sqrt{3}} & \frac{1}{\sqrt{3}} & -\frac{1}{\sqrt{2}} \\ \frac{\sqrt{2}}{2\sqrt{3}} & -\frac{1}{\sqrt{3}} & -\frac{1}{\sqrt{2}} \end{bmatrix}$$

3. Let  $\vec{v}_1 = \begin{bmatrix} 5 \\ 12 \end{bmatrix}$ ,  $\vec{v}_2 = \begin{bmatrix} 4 \\ -3 \end{bmatrix}$ .

(a) Find the lengths of  $\vec{v}_1$  and  $\vec{v}_2$ , and compute the dot product  $\vec{v}_1 \cdot \vec{v}_2$ .

$$\begin{aligned} \|\vec{v}_1\| &= \sqrt{5^2 + 12^2} = 13 \\ \|\vec{v}_2\| &= \sqrt{4^2 + (-3)^2} = 5 \\ \vec{v}_1 \cdot \vec{v}_2 &= 5 \cdot 4 + 12 \cdot (-3) = -16 \end{aligned}$$

(b) Find unit vectors in the direction of  $\vec{v}_1$  and  $\vec{v}_2$ , respectively.

$$\begin{aligned} \vec{w}_1 &= \frac{\vec{v}_1}{\|\vec{v}_1\|} = \begin{bmatrix} \frac{5}{13} \\ \frac{12}{13} \end{bmatrix} \\ \vec{w}_2 &= \frac{\vec{v}_2}{\|\vec{v}_2\|} = \begin{bmatrix} \frac{4}{5} \\ -\frac{3}{5} \end{bmatrix} \end{aligned}$$

(c) Find the angle between  $\vec{v}_1$  and  $\vec{v}_2$ .

We have:  $\cos \theta = \frac{\vec{v}_1 \cdot \vec{v}_2}{\|\vec{v}_1\| \cdot \|\vec{v}_2\|} = -\frac{16}{65}$ , and so  $\theta = 1.81951$  radians (or,  $\theta = 104.25^\circ$ ).

(d) Find the projection of  $\vec{v}_2$  onto the subspace of  $\mathbb{R}^2$  spanned by  $\vec{v}_1$ .

$$\text{proj}_{V_1} \vec{v}_2 = (\vec{w}_1 \cdot \vec{v}_2) \cdot \vec{w}_1 = -\frac{16}{13} \cdot \frac{1}{13} \begin{bmatrix} 5 \\ 12 \end{bmatrix} = \begin{bmatrix} -\frac{80}{169} \\ -\frac{192}{169} \end{bmatrix}.$$

(e) Let  $A = [\vec{v}_1 \ \vec{v}_2]$ . Use the Gram-Schmidt process to find the  $QR$ -factorization of  $A$ .

We have:

$$\begin{aligned} \vec{a}_2 &= \vec{v}_2 - \text{proj}_{V_1} \vec{v}_2 = \begin{bmatrix} \frac{756}{169} \\ \frac{169}{313} \\ -\frac{169}{169} \end{bmatrix} \\ \|\vec{a}_2\| &= \frac{63}{13} \\ \vec{w}_2 &= \frac{\vec{a}_2}{\|\vec{a}_2\|} = \begin{bmatrix} \frac{12}{13} \\ \frac{13}{63} \\ -\frac{5}{13} \end{bmatrix} \end{aligned}$$

Thus:

$$\begin{aligned} Q &= [\vec{w}_1 \ \vec{w}_2] &= \begin{bmatrix} \frac{5}{13} & \frac{12}{13} \\ \frac{12}{13} & -\frac{3}{5} \\ \frac{13}{63} & -\frac{5}{13} \end{bmatrix} \\ R &= \begin{bmatrix} \|\vec{v}_1\| & \vec{w}_1 \cdot \vec{v}_2 \\ 0 & \|\vec{v}_2\| \end{bmatrix} &= \begin{bmatrix} 13 & -\frac{16}{13} \\ 0 & 5 \end{bmatrix} \end{aligned}$$
